Real Analysis Final
Fall 2021
Raúl Curto

1. (12 points) Define:
   (a) (2 points) Uniform convergence of a sequence of functions on a set $E \subseteq \mathbb{R}$.
   (b) (3 points) Variation of a function f on a closed, bounded interval $[a, b]$, with respect to a partition P of $[a, b]$.
   (c) (2 points) Point of closure of a subset E of a metric space X.
   (d) (2 points) Equicontinuity for a colleciton $\mathcal{F}$ of real-valued functions on a metric space X.
   (e) (3 points) State the Cantor intersection theorem.

2. (8 points) Let f be a continuous function on a closed, bounded, nondegenerate interval $[a, b]$ such that

   (i) f is of bounded variation on $[a, b]$; and

   (ii) f maps sets of measure zero to sets of measure zero; that is, for E a measurable subset of $[a, b]$, $m(E) = 0 \implies m(f(E)) = 0$.

   Prove that f is absolutely continuous on $[a, b]$.
