REAL ANALYSIS FINAL FALL 2021 RAÚL CURTO

- 1. (12 points) Define:
 - (a) (2 points) Uniform convergence of a sequence of functions on a set $E \subseteq \mathbb{R}$.
 - (b) (3 points) Variation of a function f on a closed, bounded interval [a, b], with respect to a partition P of [a, b].
 - (c) (2 points) Point of closure of a subset E of a metric space X.
 - (d) (2 points) Equicontinuity for a collection \mathcal{F} of real-valued functions on a metric space X.
 - (e) (3 points) State the Cantor intersection theorem.
- 2. (8 points) Let f be a continuous function on a closed, bounded, nondegenerate interval [a, b] such that
 - (i) f is of bounded variation on [a, b]; and
 - (ii) f maps sets of measure zero to sets of measure zero; that is, for E a measurable subset of [a,b], $m(E)=0 \implies m(f(E))=0$.

Prove that f is absolutely continuous on [a, b].

3. (8 points) Let $f: \mathbb{R} \to \mathbb{R}$ be a Borel function, and define

$$\mu(E) := m(f^{-1}(E)) \quad (E \subseteq \mathbb{R}, E \text{ Borel}).$$

Prove:

- (a) $\mu(E) \ge 0$ for all E Borel;
- (b) μ is monotone;
- (c) μ is countably additive;
- (d) μ is not translation invariant; e.g., find a counterexample of a Borel function f and a set E such that $\mu(E+1) \neq \mu(E)$, where $E+1 \coloneqq \{x+1 \mid x \in E\}$.
- 4. (20 points) Determine if each of the following statements is true or false. If true, provide a proof; if false, provide a counterexample or show in some fashion why the statement is false. In either case, you are free to cite the textbook, and provide a rationale along the lines of "...by a proposition in Section a.b of Royden-Fitzpatrick."
 - (a) (4 points) True or false? Let \mathcal{F} be a collection of measurable functions on \mathbb{R} , and let

$$g\coloneqq \sup_{f\in\mathcal{F}}f.$$

Then q is measurable on \mathbb{R} .

(b) (6 points) True or false? Consider the normed linear space X of Riemann integrable functions on [0,1], with the norm $||f||_R := (R) \int_0^1 |f(x)| dx$. Then X is a Banach space. (Hint: the sequence $\{f_n\}_{n=1}^{\infty}$ of measurable functions given by

$$f_n(x) := \begin{cases} 1 & x = \frac{i}{k}, \text{ if } 1 \le k \le n \text{ and } 0 \le i \le k \\ 0 & \text{otherwise.} \end{cases}$$

The sequence $\{f_n\}$ is increasing and $f_n \to \chi_{\mathbb{Q}}$ as $n \to \infty$.)

(c) (4 points) True or false? Recall that ℓ^{∞} is the Banach space of real bounded sequences, equipped with the supremum norm. The space ℓ^{∞} is separable. (Hint: $2^{\mathbb{N}}$ is not countable.)

(d) (6 points) True or false? Let g be strictly increasing and absolutely continuous on a closed, bounded, nondegenerate interval [a, b], and let \mathcal{O} be an open subset of (a, b). Then

$$m(g(\mathcal{O})) = \int_{\mathcal{O}} g'.$$

5. (16 points) (a) (6 points) A Hilbert space \mathcal{H} may be characterized as a Banach space in which the so-called parallelogram law holds; that is, for each pair of vectors x and y in \mathcal{H} , we have

$$||x+y||_{\mathcal{H}}^2 + ||x-y||_{\mathcal{H}}^2 = 2 \cdot ||x||_2^{\mathcal{H}} + 2 \cdot ||y||_{\mathcal{H}}^2.$$

Using only characteristic functions of measurable subsets of [0,1], prove that $L^1([0,1])$ is not a Hilbert space.

(b) (10 points) (Embedding of ℓ^p in $L^p[1,\infty)$.) Let $1 \leq p < \infty$. For $a = (a_1, a_2, \dots) \in \ell^p$, define $f_a: [1,\infty) \to \mathbb{R}$ by

$$f_a(x) := \sum_{k=1}^{\infty} a_k \chi_{[k,k+1)}(x) \quad (x \in [1,\infty).$$

- i. (2 points) Prove that $f_a \in L^p[1, \infty)$.
- ii. (2 points) Prove that $||f_a||_p = ||a||_p$.
- iii. (3 points) Prove that the map $T: \ell^p \to L^p[1,\infty)$ given by $T(a) := f_a$ is linear and injective, but not surjective.
- iv. (3 points) True or false? The range of T is dense in $L^p[1,\infty)$.
- 6. (6 points) Let f be a Lipschitz function on [0,1] and let g an absolutely continuous function on [0,1]. Prove that $f \circ g$ is absolutely continuous on [0,1].
- 7. (16 points) On a closed, bounded, nondegenerate interval [a, b], consider a sequence $\{f_n\}$ of increasing, absolutely continuous functions on [a, b]. Assume:
 - (i) $f_n(a) = 0$ for all $n \in \mathbb{N}$;
 - (ii) $f'_n \leq f'_{n+1}$ a.e. on [a, b], for all $n \in \mathbb{N}$;
 - (iii) The sequence $\{f_n(b)\}$ is bounded.

Prove:

- (a) (4 points) There exists $f:[a,b]\to\mathbb{R}$ such that $\{f_n\}\to f$ pointwise on [a,b];
- (b) (6 points) f is absolutely continuous on [a, b]; and
- (c) (6 points) $\{f_n\}$ converges to f uniformly on [a,b].
- 8. (14 points) (a) (7 points) For a nonempty subset E of a metric space (X, ρ) and a point $x \in X$, define the distance from x to E by

$$\operatorname{dist}(x, E) \coloneqq \inf \{ \rho(x, y) \mid y \in E \}$$

- i. (4 points) Show that f is continuous on X.
- ii. (3 points) Show that $\overline{E} = f^{-1}(\{0\})$.
- (b) (7 points) Now define $f: X \to \mathbb{R}$ by

$$f(x) := \operatorname{dist}(x, E) \quad (x \in X).$$

i. (4 points) Assume that F is closed, and E is compact. Prove that

$$E \cap F = \emptyset \iff \operatorname{dist}(F, E) > 0.$$

ii. (3 points) Prove that the previous statement is not true if E and F are merely closed. That is, find an example of two closed sets E and F for which $\operatorname{dist}(F,E)=0$ and $E\cap F=\varnothing$. (Hint: To produce an example in \mathbb{R} , by Heine-Borel both sets need to be closed and unbounded, e.g., consider $E:=\mathbb{N}$.)
